

### **Extra Corporeal Shock Wave Lithotripsy (ESWL) machine**

Climb on board Mobile Medical Technology's lithotripsy bus and enter a one of a kind environment. New Zealand's only mobile lithotripsy machine; non-invasive kidney stone treatment is brought to suitable patients throughout New Zealand thanks to this purpose-built unit. Extra Corporeal Shock Wave Lithotripsy, ESWL, uses electric shockwaves to break up the kidney stones without damaging the surrounding tissues, a procedure carried out by our Medical Radiation Technologists. Patients are anaesthetised or sedated on board and then moved back to the hospital to recovery.

We invite you to have a look on board and see exactly how unique and innovative this facility is.
